Cambio

Get paid in MUSD. Prove it on-chain.

Wallet-signed MUSD invoices any customer can pay, even with only BTC, and settlement that anyone can verify on Mezo.

github.com/Lushegs01/cambio · cambio-five.vercel.app · Mezo Testnet (31611)

THE PAYMENT PROBLEM

Crypto invoicing still runs on copy-paste and screenshots

Links can be edited

A pasted address or a payment link can be changed in transit. The payer has no way to know the merchant wrote it.

"I paid you" is a screenshot

Merchants check explorers by hand. A payment is easy to miss, mis-attribute or double-count.

Payers hold BTC, invoices are in dollars

A BTC holder who owes a dollar amount must leave the invoice, find a DEX, size a swap and come back.

MUSD is Mezo's Bitcoin-backed dollar. Cambio makes it work as an **invoice currency** for people who already hold BTC.

WHO IT'S FOR

Start narrow: people who already get paid in crypto

Primary: crypto-paid freelancers and small studios

They invoice international clients and want a link nobody can edit, a dollar-stable asset, proof for bookkeeping, and no custody risk.

Secondary: Mezo-ecosystem merchants

Projects, communities and events whose customers already hold MUSD or BTC on Mezo.

Payers: BTC holders on Mezo

They pay a dollar invoice without leaving it, using Fund & Pay.

Persona: Ada, product designer

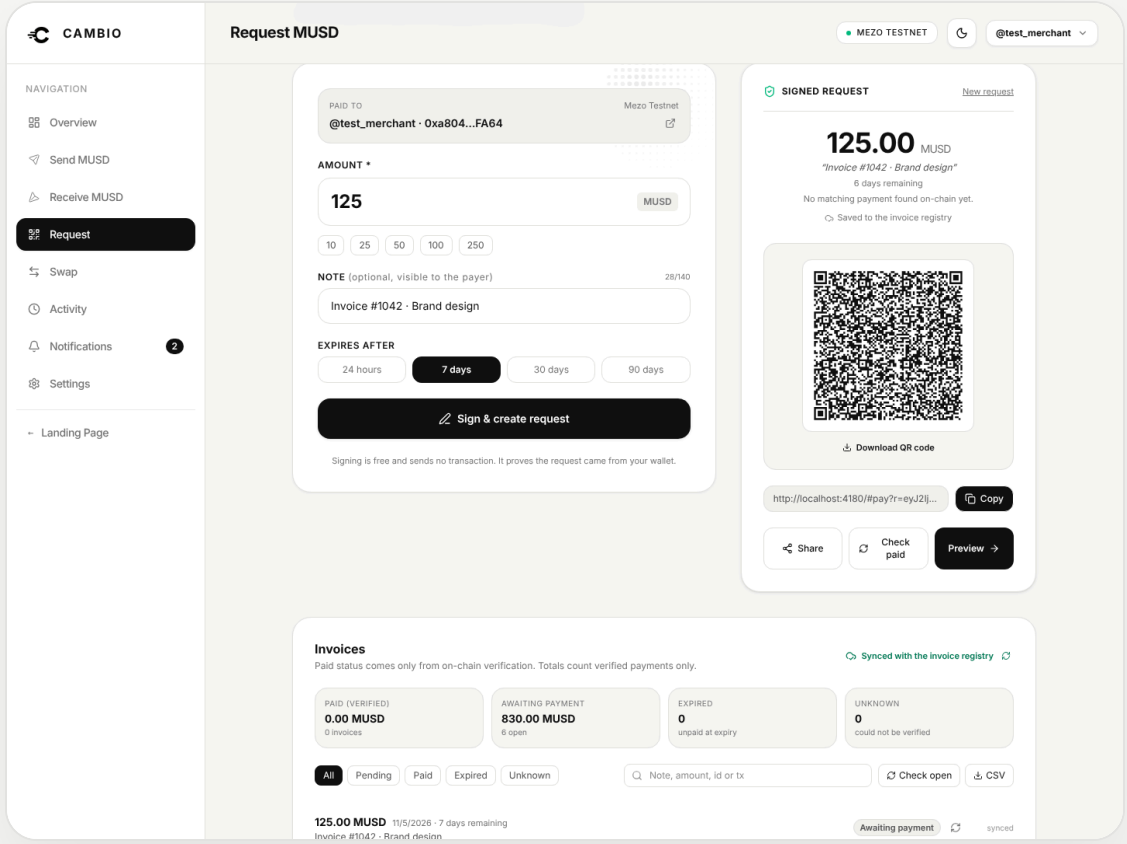

- 3–8 international clients a month, $300–$3,000 per invoice
- Today: pastes an address, asks for a screenshot, checks the explorer
- Needs: a tamper-proof link, a trusted "paid" status, a monthly export

These are hypotheses. User research has not started. We make no claim of mass-market or regional demand, and Cambio has no fiat off-ramp.

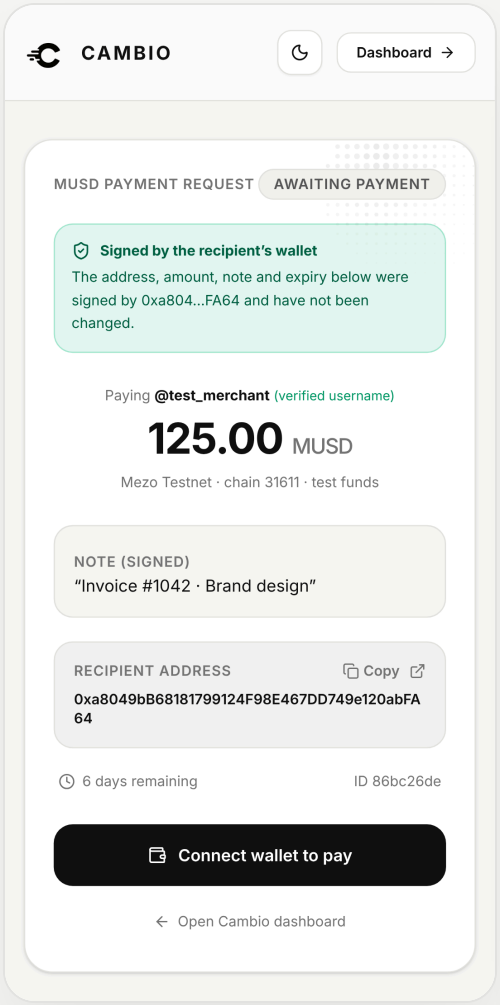

THE SOLUTION

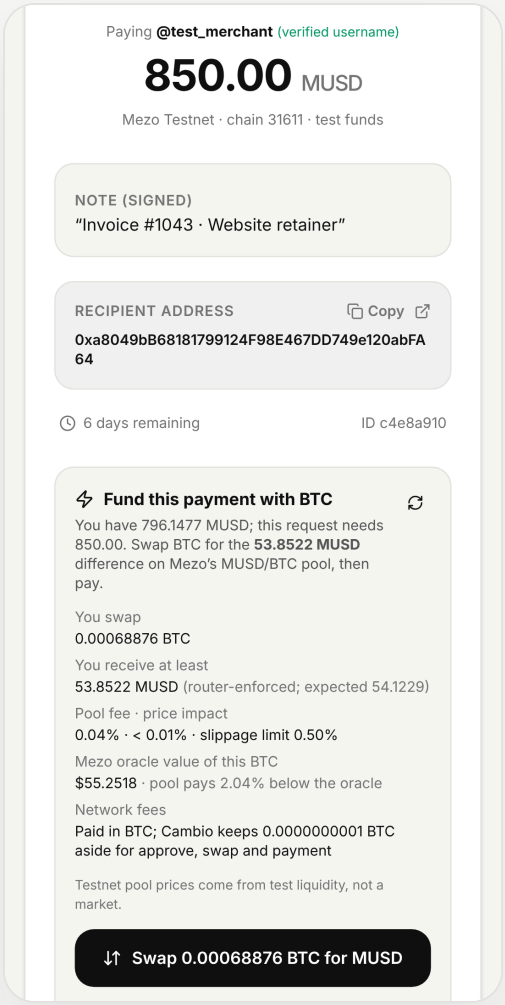

Signed invoices · Fund & Pay · verified settlement · merchant workspace

- **EIP-712 signed invoices.** The recipient, amount, token, chain, ID and expiry are signed by the merchant's wallet; the payer verifies the signature before Pay appears.
- **Verified @usernames.** Each name is bound by a server-verified SIWE signature.
- **Fund & Pay.** If the payer is short, Cambio sizes a BTC→MUSD swap for exactly the shortfall on the same page.
- **Settlement proof.** The payment carries the invoice ID in its calldata; anyone can re-check the receipt and the `Transfer` event.
- **Invoice registry.** Syncs across devices after a wallet sign-in; "paid" is only ever set by on-chain verification. Totals, filters, CSV export.

Invoice → fund with BTC → pay → verified

1. The merchant signs an invoice. It's free, and the link is saved to the registry.
2. The customer opens it: the signature is verified and Cambio checks the invoice is not already paid.
3. They're 53.85 MUSD short, so Cambio quotes 0.00068876 BTC in, with at least 53.85 MUSD out (router-enforced). The Mezo oracle value is shown alongside.
4. Exact approval → swap → pay. Each step is its own wallet prompt.
5. The server re-reads the chain and marks the invoice **Paid · verified**.

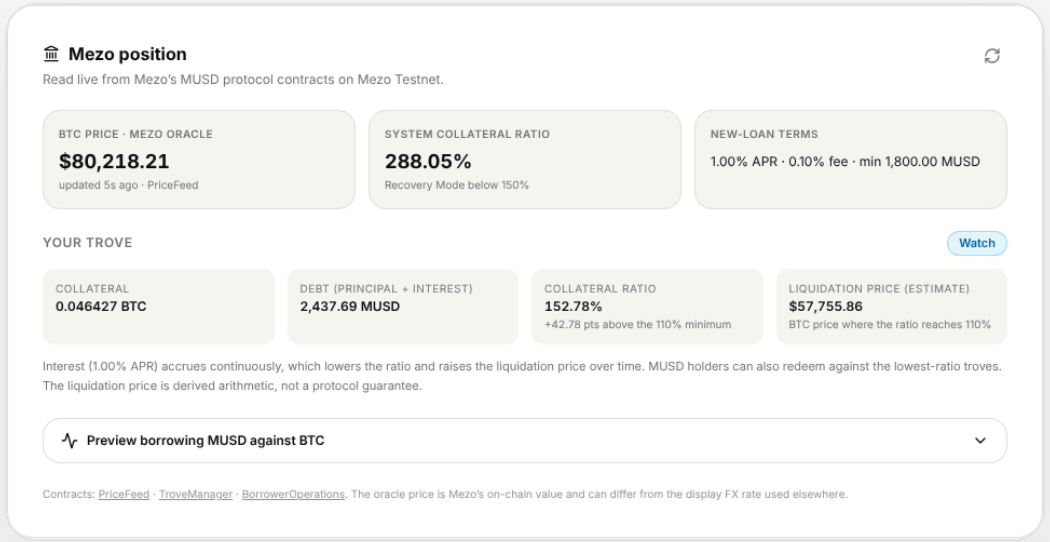

The Fund & Pay screen shows the real @lushegs wallet balance (796.1477 MUSD) against an 850 MUSD test invoice. Read-only capture; nothing was broadcast.

MEZO-NATIVE INTEGRATION

Built on Mezo's contracts, not a generic ERC-20

MEZO CONTRACT	CAMBIO USES IT FOR
MUSD	Transfers with a calldata-bound invoice ID; `Transfer`-event proof
Router · PoolFactory · MUSD/BTC pool	Quotes, on-chain fees, reserve-exact Fund & Pay sizing, exact-approval swaps
PriceFeed	BTC oracle price; a stale revert shows as stale, never as an off-chain substitute
TroveManager	Trove status, `getCurrentICR`, MCR/CCR, TCR, Recovery Mode
BorrowerOperations	Read-only `openTrove` preview: fee, minimum debt, gas compensation
Multicall3	17 → 5 RPC requests per refresh

Addresses come from the official `mezo-org/musd` deployments and are re-verified by `npm run verify:chain`. Cambio's ICR math equals a live `getCurrentICR` to the wei.

ON-CHAIN EVIDENCE (MEZO TESTNET)

Re-verified from the RPC with one command

PROOF	TRANSACTION	WHAT WAS CHECKED	VERDICT
MUSD transfer 10 MUSD, @solo → @lushegs	`0x8e39d309…5065e` `block 16390715`	Targets MUSD; `transfer` calldata; success; matching `Transfer` event; sender, recipient and amount	PASS
BTC → MUSD swap 0.01 BTC → 786.1477 MUSD	`0x4af2b0f0…33f6e` `block 16382064`	Mezo Router; BTC→MUSD route via PoolFactory; BTC into the pool; MUSD out ≥ router minimum (782.2170)	PASS
Signed-invoice settlement	`not yet recorded`	No transaction with Cambio's `CMB2` invoice-ID calldata exists yet. An e2e test proves the wallet is asked to sign exactly that calldata.	PENDING

`npm run verify:evidence` → PASS / FAIL / INCONCLUSIVE. Unreadable data is never reported as a pass. Found and fixed along the way: the public testnet RPC returned null for 25–33% of mined receipts.

Free to get paid. Merchant Pro for running a business on it.

Personal: free

Usernames, signed invoices, QR codes, settlement proof, Fund & Pay

Merchant Pro: $9/mo in MUSD

hypothesis

Cross-device registry, reconciliation, CSV, duplicate-payment alerts, reminders and branded links (to build)

Volume tier (later)

0.25% of verified volume above $2k/month (to test)

How Cambio actually collects

A non-custodial transfer pays Cambio nothing. Pro is billed with **Cambio's own signed invoice**, and the server unlocks it after a **verified settlement**, so no new contracts are needed. In-payment and routing fees would need an audited contract and are not built.

Unit economics (estimates)

About $30/month fixed at pilot scale, about $270/month at scale. Roughly 4 Pro merchants cover the pilot and 30 cover scale. Marginal cost per invoice is under a cent.

Honest status: zero users so far. The pilot is ready.

0

paying customers, revenue, or completed interviews. We claim none.

2 / 3

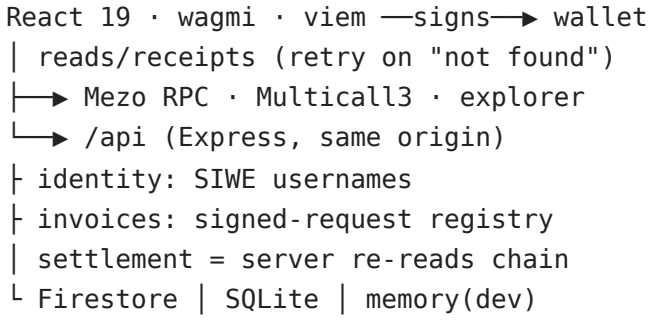

on-chain proofs verified (transfer, swap); signed settlement pending

Ready

Consent form, interview and usability scripts, and `pilot:metrics`, which counts only verifiable transactions

PILOT GOAL (NEXT 4 WEEKS)	TARGET	MEASURED BY
Consenting testnet merchants	3–5	consent forms
Verified signed-invoice settlements · distinct payers	≥ 30 · ≥ 15	`npm run pilot:metrics` (chain-derived only)
Interviews · usability sessions · willing to pay ≥ $9	10 · 5 · ≥ 3	docs/USER_RESEARCH.md

Non-custodial, composable, verified at every step

No custom smart contracts. No keys, no custody.

Controls

- Chain and account re-checked before every prompt; double-submit locks
- Exact approvals, re-quote + simulate, router minimum, 30 s quotes
- Status is never client-set; incomplete search = unknown, not unpaid
- Invoices keyed (recipient, id); SIWE session for listing
- CSP, rate limits, deny-by-default Firestore rules

Tests (2026-11-05)

250 unit/integration · 19 Firestore emulator · 20 browser e2e (production build) · 7 live read-only · ESLint 0 warnings · CI on every push. **Not audited.**

DIFFERENTIATION

Why Cambio, and why on Mezo

	WALLET SEND + PASTED ADDRESS	HOSTED CRYPTO CHECKOUT	CAMBIO
Tamper-evident request	No	Hosted page	**Merchant's EIP-712 signature, checked in the payer's browser**
Proof of payment	Screenshot	Provider dashboard	**Calldata-bound ID; anyone can verify**
Pay a dollar invoice holding only BTC	Manual DEX trip	Varies	**Fund & Pay on Mezo's MUSD/BTC pool**
Custody	None	Often custodial	**Non-custodial**
Mezo context	None	MUSD/Mezo support not verified by us	**PriceFeed, trove health, borrowing preview**

Comparison based on public product categories, not exhaustive testing. Cambio extends Mezo's own app into payments between people; it does not compete with borrowing or yield.

ROADMAP · SOLO BUILDER

Next: real merchants, real proofs, then mainnet

By Dec 15

Signed-settlement proof · redeploy · 3–5 merchant pilot with chain-derived metrics · 10 interviews

By Feb 15

Merchant Pro billing via signed invoices · reminders and webhooks · Telegram bot that creates signed invoices

By May 15

Audited checkout contract (single-use invoices, fees) · optional borrowing route · mainnet only after review
